

Ans to the q. n 2

Implementation-1

From the code we can write:

Now,

$$2^0 + 2^1 + 2^2 + 2^3 + \dots + 2^n$$

$$T(n) = \sum_{i=0}^n 2^i$$

$$= \frac{2^{n+1} - 1}{2 - 1}$$

$$= \frac{2^{n+1} - 1}{1}$$

So the time complexity is  $O(2^{n+1})$  for this code.

## Implementation - 2

As we can see in this code memoization is been used so there will be no repetition of the calculation for the same value of  $n$ . So we can say that the time complexity for this code will be  $O(n)$ .

## Ans to the Q. no. 4

On this code we can see that there are total 3 nested for loops. And every for loop is iterating  $n$  times. So the time complexity of this code will be  $O(n^3)$ .
